Disponible en ligne (Available online) : 19 mars 2013

Cette nouvelle livraison de nos ‘Eléments de bibliographie ornithologique marocaine’ regroupe une sélection d’articles traitant de l’avifaune du Maroc. Parmi ceux-ci, nous avons distingué, comme dans les livraisons précédentes, ceux traitant spécifiquement de ce pays de ceux de portée plus générale mais concernant aussi le Maroc. Un résumé informatif suit certains d’entre eux, en particulier lorsque le titre n’exprime pas de façon évidente le lien avec le Maroc.

Un troisième paragraphe présente une sélection de travaux récents relatifs à d’autres pays proches (Espagne et Iles Canaries, Portugal, Libye, Tunisie, Algérie et Mauritanie en particulier), en lien direct avec l’avifaune marocaine.

Rappelons que la majeure partie de la bibliographie ornithologique marocaine disponible fin 2001 a été référencée dans ‘*The Birds of Morocco*’ (Thévenot, Vernon & Bergier 2003. British Ornithologist Union Checklist Series 20).

Depuis, la majorité des nouveaux titres apparus ont été listés dans nos ‘Eléments de bibliographie marocaine’ :

- 1 (Bergier & Thévenot 2004 – *Go-South Bull.* 1 : 7-12),
- 2 (Thévenot & Bergier 2005 – *Go-South Bull.* 2 : 44-51),
- 3 (Thévenot & Bergier 2007 – *Go-South Bull.* 4 : 32-41),
- 4 (Thévenot & Bergier 2008 – *Go-South Bull.* 5 : 63-76),
- 5 (Thévenot & Bergier 2009 – *Go-South Bull.* 6 : 113-123),
- 6 (Thévenot & Bergier 2010 – *Go-South Bull.* 7 : 92-104),
- 7 (Thévenot & Bergier 2011 – *Go-South Bull.* 8 : 44-52),
- 8 (Thévenot & Bergier 2012 – *Go-South Bull.* 9 : 33-43)

Une ‘Bibliographie ornithologique marocaine’ est maintenue à jour à la rubrique ‘Moroccan Bibliography’ du site www.go-south.org.

Nous serions reconnaissant à toute personne ayant connaissance de publications récentes non signalées dans nos ‘Eléments de bibliographie ornithologique marocaine’ de bien vouloir nous en faire part. De même, nous vous remercions par avance de bien vouloir nous signaler toute erreur ou imprécision qui existerait dans les références présentées.

1. Nouveaux titres de bibliographie ornithologique marocaine

Il s'agit soit de titres parus en 2012 et début 2013, postérieurement à nos 'Eléments de bibliographie marocaine – 8' (cf Thévenot & Bergier 2012 – *Go-South Bull.* 9 : 33-43), soit de titres antérieurs non signalés dans nos huit précédentes livraisons.

- Hardouin, L.A. ; Nevoux, M. ; Robert, A. ; Gimenez, O. ; Lacroix, F. & Hingrat, Y.** 2012. Determinants and costs of natal dispersal in a lekking species. *Oikos* 121: 804-812. [The authors analysed the natal dispersal behaviour in 100 marked individuals of North African houbara bustards *Chlamydotis undulata undulata*, during four years in eastern Morocco. They investigated the effects of proximate factors on dispersal pattern and distance, as well as the mortality cost associated with movement using multievent models, allowing uncertainty in sex assignment and mixture of live recaptures and dead recoveries. Overall, males exhibited longer dispersal distances than females, contrary to the common pattern in birds. Moreover, males in poorer body condition moved further than those in better condition, whereas distance was independent of body condition in females. Finally, survival rates during dispersal were lower for females than for males and were negatively correlated with the distances covered with a similar distance-survival slope in the two sexes. Collectively, these results suggest that 1) there is substantial dispersal cost in both sexes, 2) dispersal is strongly male-biased, 3) this bias is unlikely to be explained by differential movement costs of each sex, and 4) dispersal differences found across different categories of individuals are in broad agreement with both the inbreeding avoidance and intraspecific competition mechanisms for dispersal]

Ranging behaviour of Eleonora's Falcons *Falco eleonorae* during chick-rearing. *Acta Ornithologica* 47: 195-198. [Two adult female Eleonora's Falcons were equipped with Argos satellite transmitters during the chick-rearing period in Morocco giving the opportunity to study the ranging behaviour of the species during at least a part of the breeding season. Results showed that the falcons spent most of the time at sea during mornings, stayed mainly inland during afternoons, and rested in the colony (Essaouira's islands) during nights. Interestingly, although most distances were recorded shorter than 50 km away from the colony, movements took also place to areas located more than 100 km away. Locating and protecting these inland areas used for resting and foraging may be of interest for the conservation of the species in order to avoid perturbations such as poisoning and habitat destruction]

2. Autres titres d'intérêt général concernant l'avifaune marocaine

Åkesson, S. ; Klaassen, R. ; Holmgren, J. ; Fox, J.W. & Hedenstrom, A. 2012. Migration Routes and Strategies in a Highly Aerial Migrant, the Common Swift *Apus apus*, Revealed by Light-Level Geolocators. *PLoS ONE* 7(7): e41195. doi:10.1371/journal.pone.0041195 [Six individuals were successfully tracked throughout a complete migration cycle from Sweden to Africa and back. The autumn migration followed a similar route in all individuals, with an initial southward movement through Europe followed by a more southwest-bound course through Western Sahara to Sub-Saharan stopovers, before a south-eastward approach to the final wintering areas in the Congo basin. After approximately six months at wintering sites, which shifted in three of the individuals, spring migration commenced in late April towards a restricted stopover area in

West Africa in all but one individual that migrated directly towards north from the wintering area. The first part of spring migration involved a crossing of the Gulf of Guinea in those individuals that visited West Africa. Spring migration was generally wind assisted within Africa... The average detour at about 50% could be explained by the existence of key feeding sites and wind patterns. The common swift adopts a mixed fly-and-forage strategy... This strategy allowed swifts to reach average migration speeds well above 300 km/day in spring, which is higher than possible for similar sized passerines]

Aliabadian, M. ; Kaboli, M. ; Förschler, M.I. ; Nijman, V. ; Chamani, A. ; Tillier, A. ; Prodon, R. ; Pasquet, E. ; Ericson, P.G.P. & Zuccon, D. 2012. Convergent evolution of

morphological and ecological traits in the open-habitat chat complex (Aves, Muscicapidae: Saxicolinae). *Molecular Phylogenetics and Evolution* 65: 35-45. [Open-habitat chats (genera *Myrmecocichla*, *Cercomela*, *Oenanthe* and relative) are a morphologically and ecologically cohesive group of genera with unclear phylogenetic relationships. They are distributed mostly in open, arid and/or rocky habitats of Africa and Eurasia. This study presents the most comprehensive molecular phylogenetic analysis of this group to date, with a complete taxon sampling at the species level. The analysis, based on a multilocus dataset including three mitochondrial and three nuclear loci, allows to elucidate the phylogenetic relationships and test the traditional generic limits. All genera are non-monophyletic, suggesting extensive convergence on similar plumage patterns in unrelated species. While the colour pattern appear to be a poor predictor of the phylogenetic relationships, some of the ecological and behavioural traits agree relatively well with the major clades]

Bairlein, F. ; Norris, D.R. ; Nagel, R. ; Bulte, M. ; Voigt, C.C. ; Fox, J.W. ; Hussell, D.J.T. & Schmaljohann, H. 2012. Cross-hemisphere migration of a 25 g songbird. *Biology Letters* 8: 505-507. [The northern wheatear (*Oenanthe oenanthe*) is a small (approx. 25 g), insectivorous migrant with one of the largest ranges of any songbird in the world, breeding from the eastern Canadian Arctic across Greenland, Eurasia and into Alaska. However, there is no evidence that breeding populations in the New World have established overwintering sites in the Western Hemisphere. Using light-level geolocators, the authors demonstrate that individuals from these New World regions overwinter in northern sub-Saharan Africa, with Alaskan birds travelling approximately 14.500 km each way and an eastern Canadian Arctic bird crossing a wide stretch of the North Atlantic (approx. 3500 km). These remarkable journeys, particularly for a bird of this size, last between one to three months depending on breeding location and season (autumn/spring) and result in mean overall migration speeds of up to 290 km d⁻¹. Stable-hydrogen isotope analysis of winter-grown feathers sampled from breeding birds generally support the notion that Alaskan birds overwinter primarily in eastern Africa and eastern Canadian Arctic birds overwinter mainly in western Africa. These results provide the first evidence of a migratory songbird capable of linking African ecosystems of the Old World with Arctic regions of the New World.]

Un des individus suivi depuis la Terre de Baffin au Canada a d'abord traversé l'Atlantique pour atteindre la Grande Bretagne (en passant

probablement par le Groenland) puis a continué vers le sud à travers l'Europe et le Maroc pour aller hiverner en Mauritanie après un voyage de 7400 km (route similaire inverse au printemps)]

Busche, G. & Becke, P. 2010. Das Vorkommen des Odinschühnchens *Phalaropus lobatus* in Deutschland und an der afrikanischen Atlantikküste. *Die Vogelwelt* 131: 185-194. [Les observations de ce phalarope se sont multipliées depuis les années 1980 le long des côtes d'Afrique de l'Ouest et du Sud. Elles concerneraient des individus d'Islande qui hivernaient en zone pélagique de l'Atlantique Est]

Calladine, J. ; du Feu, C. & du Feu, R. 2012. Changing migration patterns of the Short-eared Owl *Asio flammeus* in Europe: an analysis of ringing recoveries. *Journal of Ornithology* 153: 691-698. [Analysis of ring recovery data for Short-eared Owls *Asio flammeus* spanning 96 years, 1912-2007, identified spatial and temporal differences in migration patterns. Birds with breeding areas or natal origins in the Boreal (principally Fennoscandavia) and Continental (principally central Europe) regions tended to move the greatest distances. Although birds from the North Sea littoral and Britain tended to move shorter distances, recoveries included far eastern Europe (Russia), the Mediterranean and North Africa. Inclut des reprises au Maroc]

Catry, P. ; Dias, M.P. ; Phillips, R.A. & Granadeiro, J.P. 2011. Different Means to the Same End: Long-Distance Migrant Seabirds from Two Colonies Differ in Behaviour, Despite Common Wintering Grounds. *PLoS ONE* 6: e26079. [The paper compares the migratory and wintering behaviour of Cory's shearwaters *Calonectris diomedea* nesting in Berlengas and in the Selvagens, two colonies in contrasting oceanographic environments, separated by ca. 1200 km. Although no differences were found in winter distribution, there was a marked divergence in timing, route and the use of staging areas during the postbreeding (autumn) migration. Birds from Berlengas typically travelled to oceanic waters in the North Atlantic

for an extended stopover, whereas those from Selvagens rarely did so. Les oiseaux des deux colonies migrent le long des côtes du Maroc et hivernent en partie au large du Sahara atlantique et de la Mauritanie]

Catry, T. ; Martins, R.C. & Granadeiro, J.P. 2012. Discriminating geographic origins of migratory waders at stopover sites: insights from stable isotope analysis of toenails. *Journal of Avian Biology* 43: 79-84. [This study tests the potential of stable isotope analysis to reveal wintering origins of waders mixing at stopover sites, using the dunlin *Calidris alpina* as a case study. The authors determined stable carbon ($\delta^{13}\text{C}$) and nitrogen ($\delta^{15}\text{N}$) isotope signatures of toenails of dunlins captured during winter at reference sites along the East-Atlantic Flyway, from Mauritania to the United Kingdom. Afterwards, during spring migration, dunlins were sampled at the Tagus estuary, Portugal, and assigned to their wintering grounds according to their stable isotope signatures. Toenails from wintering dunlins at different sites had significantly different $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ signatures, despite some overlap in isotopic carbon ratios of birds from Morocco, Portugal and the UK. Among birds sampled during migration in Portugal, they found a clear bimodal pattern in $\delta^{13}\text{C}$ values, corresponding to passage migrants from Mauritania (enriched $\delta^{13}\text{C}$ values) and wintering birds from the Tagus estuary (depleted $\delta^{13}\text{C}$ values). The first passage migrants from Mauritania appeared at the Tagus estuary by the end of March, with peak numbers during late April and early May]

de Lucas, M. ; Ferrer, M. ; Bechard, M.J. & Muñoz, A.R. 2012. Griffon vulture mortality at wind farms in southern Spain: Distribution of fatalities and active mitigation measures. *Biological Conservation* 147: 184-189. [Wind is increasingly being used as a renewable energy source around the world. Avian mortality is one of the negative impacts of wind energy and a new technique that reduces avian collision rates is necessary. Using the most frequently-killed species, the griffon vulture (*Gyps fulvus*), the authors studied its mortality at 13 wind farms in Tarifa, Cadiz, Spain, before (2006-2007) and after (2008-2009) when selective turbine stopping programs were implemented as a mitigation measure. Ten wind farms (total of 244 turbines) were selectively stopped and three wind farms (total of 52 turbines) were not. They found 221 dead griffon vultures during the entire study and the mortality rate was statistically different per turbine and year among wind farms. During 2006-2007, 135 griffon vultures were found dead and the spatial distribution of mortality was not uniformly distributed among turbines, with very few turbines showing the highest mortality rates. The 10 most dangerous turbines were distributed among six different wind farms. Most of the mortalities were concentrated in October and November matching the migratory period. During 2008-2009, they used a selective stopping program to stop turbines when vultures were observed near them and the griffon vulture mortality rate was reduced by 50% with a consequent reduction in total energy production of by the wind farms by only 0.07% per year. These results indicate that the use of selective

stopping techniques at turbines with the highest mortality rates can help to mitigate the impacts of wind farms on birds with a minimal affect on energy production]

Delgado, M.P. ; Traba, J. & Morales, M.B. 2011. Climate niche constraints in two coexisting steppe birds: the little and the great bustards. *Ardeola* 52: 223-238. [This study describes the climatic factors determining the distribution of two sympatric steppe birds, the little and the great bustards *Tetrax tetrax* & *Otis tarda*, on a Western Palearctic scale. A model-averaging approach was performed to determine the weight and effect of those variables describing the climatic preferences for each species. Although both showed a preference for drier areas in Europe, the results suggest that the great bustard's climate niche is mainly defined by variables related to primary production (e.g. rainfall, soil moisture), with temperature-related variables being less influential. These results contrast with those for the little bustard, whose climate niche seems to be defined by both temperature and precipitation-related variables (e.g. annual rainfall, temperature range)]

Dias, M.P. ; Granadeiro, J.P. ; Phillips, R.A. ; Alonso, H. & Catry, P. 2011. Breaking the routine: individual Cory's shearwaters shift winter destinations between hemispheres and across ocean basins. *Proceedings of the Royal Society B: Biological Sciences* 278: 1786-93. [The study evaluates individual flexibility in migration strategy of a highly pelagic seabird, the Cory's shearwater *Calonectris diomedea*. Geolocation data from 72 different migrations, including 14 birds that were tracked for more than one non-breeding season, showed a remarkable capacity to change winter destinations between years. Although some birds exhibited high site fidelity, others shifted from the South to North Atlantic, from the western to eastern South Atlantic, and from the Atlantic to Indian Ocean. Individuals also showed flexibility in stopover behaviour and migratory schedule. Une des 6 aires d'hivernage identifiées se situe au large du Sahara Atlantique et de la Mauritanie et plusieurs individus ont longé les côtes du Sahara Atlantique lors de leur déplacements migratoires]

[L'article met en doute la reproduction de *M. f. cinereocapilla* à Massa (cf van den Berg, A.B. 2011. Breeding status of Ashy-headed Wagtail in south-western Morocco. *Dutch Birding* 33: 117-121). Pour l'auteur il s'agit de Bergeronnettes "méridionales" *M. f. cinereocapilla x iberiae* qui nichent aussi dans le sud de la France et le Nord-est de l'Espagne. Quelques observations marocaines (clichés à l'appui) pourraient cependant concerter cette forme dont la présence serait "marginale et occasionnelle au Maroc"]

Duijns, S. ; Jukema, J. ; Spaans, B. ; Horssen, P. & Piersma, T. 2012. Revisiting the proposed leap-frog migration of Bar-tailed godwits along the East-Atlantic Flyway. *Ardea* 100: 37-43. [Two populations of Bar-tailed Godwits *Limosa lapponica* occur along the East-Atlantic Flyway. The European population (*L. l. lapponica*) is supposed to breed in northern Scandinavia and has been suggested to only winter in Europe. The Afro-Siberian population (*taymyrensis*) is supposed to breed in Northern Siberia and is thought to winter exclusively in West Africa. An analysis of 946 metal ring recoveries accumulated by EURING, in combination with an analysis of over 13,000 resightings of almost 4000 individuals marked with colour-rings in 2001-2010, enabled the authors to examine whether there is evidence for overlap of the populations in summer and winter. Nearly all marked individuals behaved according to the previously suggested leap-frog migration pattern. The distinct migratory behaviour of the two populations makes them near completely separated in summer and winter. The Bar-tailed Godwit along the East-Atlantic Flyway thus exhibits a clear leap-frog migration, in which the Siberian breeders winter south of the European breeders]

Mediterranean form a single interbreeding population and share a common history. *Journal of Avian Biology* 43: 341-354. [The greater flamingo *Phoenicopterus roseus* is a long-lived colonial waterbird species, characterized by a large range encompassing three continents, a very limited number of breeding sites, and high dispersal abilities. The authors investigated both the phylogeographic history and the contemporary extent of genetic differentiation between eight different Mediterranean breeding colonies of greater flamingos sampled between 1995 and 2009, using both mitochondrial DNA and microsatellite markers. They found no significant differences in allelic richness or private allelic richness in relation to colony size. Overall, no genetic population differentiation was detected using either mitochondrial or microsatellite markers]

Gómez-Díaz, E. ; González-Solís, J. & Peinado, M.A. 2009. Population structure in a highly pelagic seabird, the Cory's shearwater (*Calonectris diomedea*): an examination of genetics, morphology and ecology. *Marine Ecology Progress Series* 382: 197-209. [The authors investigated the role of oceanic transitions versus population genetic processes in driving population differentiation in the Cory's shearwater, combining molecular, morphological and ecological data from 27 breeding colonies distributed across the Mediterranean (*Calonectris diomedea diomedea*) and the Atlantic (*C. d. borealis*). Genetic and biometric analyses showed a clear differentiation between Atlantic and Mediterranean Cory's shearwaters. Ringing recovery data indicated high site fidelity of the species, but they found some cases of dispersal among neighboring breeding sites (<300 km) and a few long distance movements (>1000 km) within and between each basin. In agreement with this, comparison of phenotypic and genetic data revealed both current and historical dispersal events. Within each region, they did not detect any genetic substructure among archipelagos in the Atlantic, but they found a slight genetic differentiation between western and eastern breeding colonies in the Mediterranean. In line with previous studies, genetic, phenotypic and ecological evidence supported the separation of Atlantic and Mediterranean forms, suggesting the 2 taxa should be regarded as different species]

González-Solís, J. ; Ruiz, X. & Jover, L. 1997. Influence of food availability on interactions between *Larus cachinnans* and *L. audouinii*. *Canadian Journal of Zoology* 75: 719-724. [*Larus audouinii*, the Audouin's gull, is a threatened species breeding in sympatry with the larger *L. cachinnans*, the yellow-legged gull, throughout the Mediterranean. The yellow-legged

gull has often been cited as the main threat to the Audouin's gull. On the Chafarinas Islands, the second largest breeding place for Audouin's gulls in the world, both gull species depend largely on commercial fisheries for food]

González-Solís, J. ; Croxall, J.P. ; Oro, D. & Ruiz, X. 2007. Trans-equatorial migration and mixing in the wintering area of a pelagic seabird. *Frontiers in Ecology and the Environment* 5: 297-301. [Despite the increasing interest in long distance migration, the wintering areas, migration corridors and population mix in winter quarters of most pelagic marine predators are unknown. This paper presents the first study to track migration movements of shearwaters throughout the complete non-breeding period. The authors used geolocators (global location sensing (GLS) units based on ambient light levels) to track 22 Cory's shearwaters *Calonectris diomedea*, breeding in three different areas. Most birds wintered in one or more of three relatively small areas, all clearly associated with major coastal upwelling systems of the tropical and south Atlantic. Transequatorial movements were dominated by prevailing trade winds and westerlies and avoided calm oligotrophic areas. Breeding populations clearly differed in their main preference amongst the three major wintering areas but showed substantial mixing]

González-Solís, J. ; Smyrli, M. ; Militão, T. ; Gremillet, D. ; Tveraa, T. ; Phillips, R.A. & Boulinier, T. 2011. Combining stable isotope analyses and geolocation to reveal kittiwake migration. *Marine Ecology Progress Series* 435: 251-261. [To understand the migration strategies of kittiwakes *Rissa tridactyla* the authors tracked 6 kittiwakes from Norway with light level geolocators over one year. After breeding, all tracked birds moved east of the Svalbard archipelago and subsequently migrated to the Labrador Sea. Thereafter, birds showed individual variation in migration strategies; three travelled to the NE Atlantic (dont une près des côtes marocaines au large d'El-Jadida) whereas the others remained in the Labrador Sea until the end of the wintering period]

[El uso de radares de seguimiento marino combinados con censos visuales simultáneos constituye una herramienta útil para el estudio cualitativo y cuantitativo de la migración de las aves marinas en el área del Estrecho de Gibraltar y otras áreas oceánicas. Además, el hecho de usar ambas metodologías combinadas permite solventar los problemas que ambas metodologías presentan al utilizarse separadamente, proporcionando una información detallada y correcta. Toda esta información es necesaria para elaborar estudios aplicados con relevancia en la conservación de estas aves, y un ejemplo de estos estudios es la evaluación de los posibles efectos de los parques eólicos marinos sobre determinadas poblaciones de aves marinas]

Mateos-Rodríguez, M. & Bruderer, B. 2012. Flight speeds of migrating seabirds in the Strait of Gibraltar and their relation to wind. *Journal of Ornithology* 153: 881-889. [This study investigates the influence of wind on the air speed of pelagic seabirds in the Strait of Gibraltar by means of radar measurements. The birds were identified visually at the species level. An interspecific comparison under negligible wind speeds showed a slight increase of air speed in the order from Cory's Shearwater, a typically gliding species (12.8 m s^{-1}), Balearic Shearwater (gliding with flapping, 14.7 m s^{-1}), gannets (flap-gliding, 15.0 m s^{-1}), Great Skua (flapping, 16.0 m s^{-1}) to auks (fast flapping, 17.4 m s^{-1}). All of the studied species decreased their air speed with increasing wind increment (ground speed minus air speed), and this occurred in following winds slightly less than in opposing winds. Auks adjusted air speed to wind increment only in opposing winds, suggesting that auks are not able to reduce their high air speed in following winds due to extremely high wing loading]

Mellone, U. ; Klaassen, R.H.G. ; Garcia-Ripolles, C. ; Limiñana, R. ; Lopez-Lopez, P. ; Pavon, D. ; Strandberg, R. ; Urios, V. ; Vardakakis, M. & Alerstam, T. 2012. Interspecific Comparison of the Performance of Soaring Migrants in Relation to Morphology, Meteorological Conditions and Migration Strategies. *PLoS ONE* 7: e39833. [This paper compares travel speeds of four raptor species (*Neophron percnopterus*, *Circaetus gallicus*, *Pandion haliaetus* and *Circus aeruginosus*) during their crossing of the Sahara desert. The authors tracked raptors using GPS satellite transmitters from Sweden, Spain and Italy, and evaluated their migratory performance at both an hourly and a daily scale. Despite a clear variation

in morphology, interspecific differences were generally very small, and did only arise in spring, with long-distance migrants ($>5000 \text{ km}$: osprey and Western marsh-harrier) being faster than species that migrate shorter distances (Egyptian vulture and short-toed eagle). These results suggest that the most important factor explaining hourly variation in flight speed is time of day, while at a daily scale, tailwind support is the most important factor explaining variation in daily distance. Les 4 espèces étudiées traversent le Sahara en passant en partie par le Maroc. Le Sahara Atlantique est traversé par *P. haliaetus*, *C. aeruginosus* et *N. percnopterus* au printemps et surtout par *P. haliaetus* à l'automne]

Neves, V.C. ; Bried, J. ; González-Solís, J. ; Roscales, J.L. & Clarke, M.R. 2012. Feeding ecology and movements of the Barolo shearwater *Puffinus baroli baroli* in the Azores, NE Atlantic. *Marine Ecology Progress Series* 452: 269-285. [Study on the movements and feeding ecology of the Macaronesian shearwater *Puffinus baroli* in a colony from the Azores archipelago (NE Atlantic). During the chick-rearing period, parents visited their nests most nights, foraged mainly south of the colony and fed at lower trophic levels than during the non-breeding period. Squid was the most diverse prey. After the breeding period, birds dispersed offshore in all directions and up to 2500 km from the breeding colony and fed at higher trophic levels]

Päckert, M. ; Martens, J. ; Wink, M. ; Feigl, A. & Tietze, D.T. 2012. Molecular phylogeny of Old World swifts (Aves: Apodiformes, Apodidae, *Apus* and *Tachymarptis*) based on mitochondrial and nuclear markers. *Molecular Phylogenetics and Evolution* 63: 606-616. [Molecular phylogeny for Old World swifts of genera *Apus* and *Tachymarptis* based on a taxon-complete sampling at the species level. In contrast to previous hypotheses, the two genera *Apus* and *Tachymarptis* were shown as reciprocally monophyletic in all reconstructions. *Apus* was consistently divided into three major clades: 1) East Asian clade of *A. pacificus* and *A. acuticauda*, 2) African-Asian clade of *A. caffer*, *A. batesi*, *A. horus*, *A. affinis* and *A. nipalensis*, 3) African-Palearctic clade of eight currently accepted species among which sequences of *A. apus* and *A. pallidus* clustered in a terminal crown clade. Phylogenetic signal of all four nuclear markers was extremely shallow within and among species of tribe Apodini and even

among genera, such that intra- and intergeneric relationships of *Apus*, *Tachymarptis* and *Cypsiurus* were poorly resolved by nuclear data alone. Four species, *A. pacificus*, *A. barbatus*, *A. affinis* and *A. caffer* were consistently found to be paraphyletic with respect to their closest relatives and possible taxonomic consequences are discussed]

Perktas, U. 2011. Ecogeographical variation of body size in Chaffinches *Fringilla coelebs*. *Bird Study* 58: 264-277. [Significant geographic variation in body size occurs throughout Eurasia and North Africa and this variation is best explained by Boyce's seasonality hypothesis rather than Bergmann's rule. Chaffinches from North Africa were larger than those from Eurasia, contrary to Bergmann's rule. This pattern might be explained by a continental effect, because North Africa differs from Eurasia in climatic and ecological features, leading to different selective pressures on these populations. Body size showed opposite relationships with geographical and climatic data in the two continents and this gave support to a continental effect on body size variation. Seasonality of primary productivity seemed to be the best explanation for body size variation in Chaffinches]

Piersma, T. ; van der Velde, M. ; El-Hacen, E.H.M. ; Lok, T. & Overdijk, O. 2012. Molecular verification of the subspecies status of the Mauritanian Spoonbill *Platalea leucorodia balsaci*. *Ardea* 100: 131-136. [In 1974 R. de Naurois and F. Roux proposed that the distinct morphology of Eurasian Spoonbills *Platalea leucorodia* breeding on offshore islands in the Banc d'Arguin, Mauritania, in comparison with the sympatrically wintering northwest European breeding Spoonbills *Platalea leucorodia leucorodia*, justifies recognition as a separate subspecies *Platalea leucorodia balsaci*. This proposal is examined here on the basis of variation in nuclear DNA, microsatellites identified earlier for *P. minor* and *P. ajaja*. We show that there is significant variation between Spoonbills breeding in Mauritania ($n = 25$) and the sympatrically wintering conspecifics breeding in the Dutch Wadden Sea ($n = 105$). Of the total genetic variation among the 130 individuals, 6.3% is attributable to variation between the two breeding areas (93.7% of the variation is within breeding areas). Pairwise FST values showed low genetic differentiation ($FST < 0.012$) among breeding colonies within The Netherlands. The level of genetic differentiation indicates that the level of gene flow between The Netherlands and Mauritania is much lower (~4–5 individuals/generation) than among the Dutch colonies on separate Wadden Sea islands. Field observations on individually colour-marked birds

from The Netherlands indeed suggest extensive dispersal within northwest Europe, with some introgression of *leucorodia* genes into the *balsaci* population. The level of microsatellite distinctiveness between sympatric populations of the two subspecies is similar to that recorded for subspecies of other migrant birds, and as such justifies the subspecies status of the Mauritanian Spoonbill]

Sardà-Palomera, F. ; Puigcerver, M. ; Brotons, L. & Rodríguez-Teijeiro, J.D. 2012. Modelling seasonal changes in the distribution of Common Quail *Coturnix coturnix* in farmland landscapes using remote sensing. *Ibis* 154: 703-713. [The authors aimed to build a species' distribution model for the Common Quail *Coturnix coturnix*, a farmland species that shows changes in its distribution in response to seasonal changes in habitat suitability. During the course of three breeding seasons they collected temporal replicates of presence-absence data in 13 sampling locations in four countries (Morocco, Portugal, Spain and France). The preferred model showed that occurrence was highly dependent on habitat changes associated with crop seasonality, as measured by a normalized difference vegetation index. Common Quail selected areas with dense vegetation and warm climate and tracked spatial changes in these two parameters]

Sokolov, L. 2011. Modern telemetry: New possibilities in ornithology. *Biology Bulletin* 38: 885-904. [Modern methods of bird telemetry and some results obtained using these methods are considered in this review. The development of high-technology methods for tracking bird movements has significantly broadened or even changed our views on the life of birds. Plusieurs exemples cités concernent des oiseaux migrant à travers le Maroc (*Circus pugargus*, *Falco eleonorae*) ou le long des côtes marocaines (*Sterna paradisea*)]

Vardanis, Y. ; Klaassen, R.H.G. ; Strandberg, R. & Alerstam, T. 2011. Individuality in bird migration: routes and timing. *Biology Letters* 7: 502-505. [Cette étude présente les trajets de sept Busards des roseaux (*Circus aeruginosus*) adultes et analyse les variations individuelles interannuelles des itinéraires suivis et des dates de migration de 2004 à 2009. Elle montre que les dates varient beaucoup moins que les trajets. Ainsi, alors que la phénologie annuelle de la migration pour un même individu est remarquablement constante, il existe une variation considérable dans le choix des parcours. Cette découverte inattendue pourrait être liée à un fort contrôle endogène des dates de migration, alors que les variations des conditions environnementales (météorologiques et d'habitats) pourraient expliquer la flexibilité dans le choix des itinéraires. Une figure montre que les Busards des roseaux traversent le Maroc et le

Sahara Atlantique au printemps, mais qu'ils passent plus à l'est à l'automne où seulement

quelques-uns passent par le Maroc oriental et l'intérieur du Sahara]

Dispersal of Yellow-legged Gulls *Larus michahellis* ringed in Algeria: a preliminary analysis. *Ardeola* 59 : 137-144. [Preliminary analysis of observations of ringed yellow-legged gulls from Algerian colonies indicates that juveniles dispersed in a northwesterly direction to the Balearic Sea and the Bay of Biscay, and westwards to the Alborán Sea and the Iberian Atlantic coast from Cádiz Bay to Galicia. Preliminary results suggested two distinct routes: gulls from the eastern Algerian colonies moved N/NW to eastern Spain and overland to the Bay of Biscay. Juveniles from western colonies seemed to move N/NW to the Alborán Sea and Cádiz Bay. In Spain, to where most dispersal occurred, the data suggests that Algerian gulls summered at coastal areas before returning to North Africa in late autumn and winter]

Using a capture-recapture approach for modelling the detectability and distribution of Houbara Bustard in southern Tunisia. *Bird Conservation International* 22: 288-298. [The aim of this study was to explore the possibility of using the capture-recapture approach in the context of Houbara Bustard *Chlamydotis undulata* in southern Tunisia. The results show once more the low detectability of this species and stress the need to take this factor into account when estimating Houbara spatial distribution. The distribution of Houbara in southern Tunisia is more likely to be shaped by human-related than by habitat factors. In particular, Houbara occurrence was positively associated with site remoteness and camel numbers. Houbara seemed to avoid areas with high human presence and shared the most remote and agriculture-free zones with free-ranging camels]

Do different subspecies of Black-tailed Godwit *Limosa limosa* overlap in Iberian wintering and staging areas? Validation with genetic markers. *Journal of Ornithology* 154: 35-40. [The Iceland-breeding subspecies *islandica* of Black-tailed Godwits *Limosa limosa*, shows overlap during the non-breeding season with the continental-Europe-breeding *limosa*. On the basis of variation in the control region of mitochondrial DNA, it was already shown that there is a clear geographic structure in their phylogeography and a clear discrimination between the haplotypes of the two subspecies. Using samples of 113 birds with known breeding origin, and on the basis of haplotype variation, all birds were properly assigned to each subspecies. The authors then tested for overlap during non-breeding season using a sample of 278 birds from an Iberian wintering and staging area, the inland rice fields in southwest Iberia (Extremadura, Spain). They showed that even in this inland area, 6.5 % of the birds belonged to *islandica*]

Samraoui, F. ; Nedjah, R. ; Boucheker, A. ; Alfarhan, A.H. & Samraoui, B. 2012. Patterns of resource partitioning by nesting herons and ibis: How are odonata exploited? *Comptes Rendus Biologies* 335: 310-317. [A relationship between prey size and bird predator has been observed in Numidia wetlands (NE Algeria) by six species of birds (Purple Heron, Black-crowned Night Heron, Glossy Ibis, Little Egret, Squacco Heron and Cattle Egret) during the breeding period, which also shows a temporal gradient for the six species. The results indicated a high degree of resource overlap. However, a distinction of prey based on taxonomy (suborder and family) and developmental stage (larvae or adults) reveals a clear size dichotomy with large-sized predators (Purple Heron, Black-crowned Night Heron and Glossy Ibis) preying on large preys like Aeshnids and Libellulids and small-sized predators feeding mainly on small prey like Zygoptera. Overall, the resource utilization suggests a pattern of resource segregation by coexisting nesting herons and ibis based on the

timing of reproduction, prey types, prey size and foraging microhabitats]
