---

Cette nouvelle livraison de nos ‘Eléments de bibliographie ornithologique marocaine’ regroupe une sélection d’articles traitant de l’avifaune du Maroc. Parmi ceux-ci, nous avons distingué, comme dans les livraisons précédentes, ceux traitant spécifiquement de ce pays de ceux de portée plus générale mais concernant aussi le Maroc. Un résumé informatif suit certains d’entre eux, en particulier lorsque le titre n’exprime pas de façon évidente le lien avec le Maroc.

Un troisième paragraphe présente une sélection de travaux récents relatifs à d’autres pays proches (Espagne et îles Canaries, Portugal, Libye, Tunisie, Algérie et Mauritanie en particulier), en lien direct avec l’avifaune marocaine.

Rappelons que la majeure partie de la bibliographie ornithologique marocaine disponible fin 2001 a été référencée dans ‘*The Birds of Morocco*’ (Thévenot, Vernon & Bergier 2003. British Ornithologist Union Checklist Series 20). Depuis, la majorité des nouveaux titres apparus ont été listés dans nos ‘Eléments de bibliographie marocaine’ :

- 1 (Bergier & Thévenot 2004 – *Go-South Bulletin* 1 : 7-12)
- 2 (Thévenot & Bergier 2005 – *Go-South Bulletin* 2 : 44-51)
- 3 (Thévenot & Bergier 2007 – *Go-South Bulletin* 4 : 32-41)
- 4 (Thévenot & Bergier 2008 – *Go-South Bulletin* 5 : 63-76)
- 5 (Thévenot & Bergier 2009 – *Go-South Bulletin* 6 : 113-123)
- 6 (Thévenot & Bergier 2010 – *Go-South Bulletin* 7 : 92-104)
- 7 (Thévenot & Bergier 2011 – *Go-South Bulletin* 8 : 44-52)
- 8 (Thévenot & Bergier 2012 – *Go-South Bulletin* 9 : 33-43)
- 9 (Thévenot & Bergier 2013 – *Go-South Bulletin* 10 : 86-101)
- 10 (Thévenot & Bergier 2014 – *Go-South Bulletin* 11 : 50-69)
- 11 (Thévenot & Bergier 2015 – *Go-South Bulletin* 12 : 84-98)

Une ‘Bibliographie ornithologique marocaine’ est maintenue à jour à la rubrique ‘*Moroccan Bibliography*’ du site [www.go-south.org](http://www.go-south.org).

Nous serions reconnaissant à toute personne ayant connaissance de publications récentes non signalées dans nos ‘Eléments de bibliographie ornithologique marocaine’ de bien vouloir nous en faire part. De même, nous vous remercions par avance de bien vouloir nous signaler toute erreur ou imprécision qui existerait dans les références présentées.

## 1. Nouveaux titres de bibliographie ornithologique marocaine

Il s'agit soit de titres parus en 2015 et début 2016, postérieurement à nos 'Eléments de bibliographie marocaine – 11' (cf. Thévenot & Bergier 2015 – *Go-South Bulletin* 12 : 84-98), soit de titres antérieurs non signalés dans nos onze précédentes livraisons.

**Abdenbi, S. ; Harak, A. ; Zerdouk, S. ; Habib, A. ; Hadi, H. ; Mellone, U. ; Urios, V. ; Bouchri, H. & Rguibi Idrissi, H.** 2016. Conservation The Mogador Island colony of Eleonora's Falcon *Falco eleonorae* Project: methods for a population assessment and study of breeding parameters. Pp. 58-62 in Yésou, P. ; Sultana, J. ; Walmsley, J. & Azafzaf, H. 2016. *Conservation of Marine and Coastal Birds in the mediterranean*. Proceedings of the UneP-Map-Rac/Spa Symposium, Hamammet 20 to 22 February 2015, Tunisia.

- Palacín, C. ; Martín, B. ; Onrubia, A. & Alonso, J.C.** 2016. Assessing the extinction risk of the great bustard *Otis tarda* in Africa. *Endangered Species Research* 30: 73-82. [Moroccan great bustards are the southernmost population of this species, and thus show the characteristics of a peripheral population: small size, isolation and low gene flow. Available counts indicate a severe population decline (62% in the last 15 yr), as well as a contraction of the species' distribution. The authors used a population viability analysis (PVA) to evaluate the quasi-extinction risk and to identify the most important threats. The estimated geometric growthrate of the more realistic of a set of possible scenarios was 0.87 (95% CI: 0.85, 0.89). This implies a 13% annual decline over 50 yr. PVA showed the negative consequence of human-induced mortality. According to the model that best fits the census data and if present threats remain in the coming years, this peripheral population could go extinct in ca. 20 yr...]

## 2. Autres titres d'intérêt général concernant l'avifaune marocaine

**Adamík, P. ; Emmenegger, T. ; Briedis, M. ; Gustafsson, L. ; Henshaw, I. ; Krist, M. ; Laaksonen, T. ; Liechti, F. ; Procházka, P. ; Salewski, V. & Hahn, S.** 2016. Barrier crossing in small avian migrants: individual tracking reveals prolonged nocturnal flights into the day as a common migratory strategy. *Scientific Reports* 6: 21560. [Over decades it has been unclear how individual migratory songbirds cross large ecological barriers such as seas or deserts. By deploying light-level geolocators on four songbird species (*Ficedula albicollis*, *F. hypoleuca*, *Acrocephalus scirpaceus*, *A. paludicola*), the authors found that these otherwise mainly nocturnal migrants seem to regularly extend their nocturnal flights into the day when crossing the Sahara Desert and the Mediterranean Sea. The proportion of the proposed diurnally flying birds gradually declined over the day with similar landing patterns in autumn and spring. The prolonged flights were slightly more frequent in spring than in autumn, suggesting tighter migratory schedules when returning to breeding sites...]

**Alaei Kakhki, N. ; Aliabadian, M. & Schweizer, M.** 2016. Out of Africa: biogeographic history of the open-habitat chats (Aves, Muscicapidae: Saxicolinae) across arid areas of the old world. *Zoologica Scripta* 45: 237-251. [...The diversification of open-habitat chats was initiated in the late Miocene at around 7.4 Ma, most likely in sub-Saharan Africa. Southern Africa and the Horn of Africa acted as centres of diversification and biogeographic expansion. From the latter area, the Arabo-Sindic region and subsequently further parts of Eurasia and North Africa were colonized. The colonization history out of sub-Saharan Africa contrasts with that of several other songbird clades, where a biogeographic expansion from Eurasia or northern Africa to southern Africa was prevalent...]

**Ambrosini, R. ; Cuervo, J.J. ; du Feu, C. ; Fiedler, W. ; Musitelli, F. ; Rubolini, D. ; Sicurella, B. ; Spina, F. ; Saino, N. & Møller, A.P.** 2016. Migratory connectivity and effects of winter temperatures on migratory behaviour of the European robin *Erithacus rubecula*: a continent-wide analysis. *Journal of Animal Ecology* 85: 749-760.

**Arizaga, J. ; Alonso, D. ; Cortés, J.A. ; Eggenhuizen, T. ; Foucher, J. ; Franz, D. ; García, J. ; Koning,**

**F. ; Leconte, M. ; Rguibi, H. ; Valkenburg, T. ; Vera, P. & Hobson, K.A.** 2015. Migratory connectivity in European bird populations: feather stable isotope values correlate with biometrics of breeding and wintering bluethroats *Luscinia svecica*. *Ardeola* 62: 255-268. [The aim of this study was to identify the possible migratory connectivity of bluethroats *Luscinia svecica* breeding in central and western Europe (subspecies *L. s. namnetum*, *L. s. azuricollis* and *L. s. cyanecula* in part) with their wintering areas in southern Europe and Africa using biometric and stable isotopic (!<sup>2</sup>H) analyses. Overall, the morphological and stable isotopes analyses provided two clusters of localities, one for the Atlantic French, Portuguese and Moroccan localities, corresponding to the breeding and winter quarters of *L. s. namnetum*, and another for the remaining localities (Spain, The Netherlands, Germany and Senegal), corresponding to the ranges of *L. s. azuricollis* and *L. s. cyanecula*. Migratory connectivity of *L. s. namnetum* is strong but it is much weaker for the other two subspecies...]

**Arizaga, J. ; van Wilgenburg, S.L. ; Alonso, D. ; Cortés, J.A., Leconte, M. ; Rguibi, H. ; Valkenburg, T. ; Vera, P. & Hobson, K.A.** 2016. Breeding origins and pattern of migration of Bluethroats *Luscinia svecica* wintering from Iberia to Senegal as revealed by stable isotopes. *Bird Study* 63: 196-202. [Stable isotope analyses reveal some degree of migratory connectivity of Bluethroat populations wintering from Iberia to West Africa. Etude menée dans des sites d'hivernage du Portugal (2), d'Espagne (2), du Maroc (2) et du Sénégal (1)]

**Arlt, D. ; Olsson, P. ; Fox James, W. ; Low, M. & Pärt, T.** 2015. Prolonged stopover duration characterises migration strategy and constraints of a long-distance migrant songbird. *Animal Migration* 2: 47-62. [The authors used light-sensitive geolocators to identify the migratory routes and schedules of 12 northern wheatears (*Oenanthe oenanthe*) breeding in Sweden. The wheatears performed a slow migration with considerable stopover time (84%/76% of autumn/spring migration), with short stops while traveling through Europe, and a prolonged stopover period in both autumn and spring in the Mediterranean region. Spring migration was faster than autumn migration, mainly because of decreased stopover time. Migration routes and

time schedules were similar to those from a German breeding population... Sur les 12 oiseaux suivis, cinq ont traversé l'est du Maroc à l'automne et/ou au printemps]

**Arroyo, G.M. ; Mateos-Rodriguez, M. ; Muñoz, A.R. ; De La Cruz, A. ; Cuenca, D. & Onrubia, A.** 2016. New population estimates of a critically endangered species, the Balearic Shearwater *Puffinus mauretanicus*, based on coastal migration counts. *Bird Conservation International* 26: 87-99. [The Balearic Shearwater is considered one of the most threatened seabirds in the world, with the breeding population thought to be in the range of 2,000-3,200 breeding pairs, from which global population has been inferred as 10,000 to 15,000 birds. To test whether the actual population of Balearic Shearwaters is larger than presently thought, the authors analysed the data from four land-based census campaigns of Balearic Shearwater post-breeding migration through the Strait of Gibraltar (mid-May to mid-July 2007-2010). The raw results of the counts, covering from 37% to 67% of the daylight time throughout the migratory period, all revealed figures in excess of 12,000 birds, and went up to almost 18,000 in two years. Generalised Additive Models were used to estimate the numbers of birds passing during the time periods in which counts were not undertaken (count gaps), and their associated error. The addition of both counted and estimated birds reveals figures of between 23,780 and 26,535 Balearic Shearwaters migrating along the north coast of the Strait of Gibraltar in each of the four years of our study...]

**Austin, J.J. ; Bretagnolle, V. ; Pasquet, E. & Burger, A.E.** 2004. A global molecular phylogeny of the small *Puffinus* shearwaters and implications for systematics of the Little–Audubon's shearwater complex. *The Auk* 121: 847-864.

**Brambilla, M. ; Vitulano, S. ; Ferri, A. ; Spina, F. ; Fabbri, E. & Randi, E.** 2012. An unexpected pattern of migration revealed in the Subalpine Warbler *Sylvia cantillans* complex by mitochondrial DNA analyses. *Ibis* 154: 616-620.

**Briedis, M. ; Beran, V. ; Hahn, S. & Adamík, P.** 2016. Annual cycle and migration strategies of a habitat specialist, the Tawny Pipit *Anthus campestris*, revealed by geolocators. *Journal of Ornithology* 157: 619-626. [This study used light-level geolocators to identify migration routes and non-breeding areas of a distinct specialist for dry habitats, the Tawny Pipit *Anthus campestris*, from a currently declining central

European breeding population. During autumn and spring migration, the majority of the birds followed a route along the northwest of the Alps and via the Iberian Peninsula, with stopover sites mainly in northern Africa. In each migration season, however, one of two different individuals took a detour around the eastern side of the Alps. When crossing the main ecological barrier, the Sahara Desert, three of six birds followed the Atlantic coastline in autumn, whereas all five birds migrated near the coast in spring]

**Catry, T. ; Lourenço, P.M. ; Lopes R.J. ; Carneiro, C. ; Alves, J.A. ; Costa, J. ; Rguibi-Idrissi, H. ; Bearhop, S. ; Piersma, T. & Granadeiro, J.P.** 2016. Structure and functioning of intertidal food webs along an avian flyway: a comparative approach using stable isotopes. *Functional Ecology* 30: 468-478. [Food webs and trophic dynamics of coastal systems have been the focus of intense research throughout the world, as they prove to be critical in understanding ecosystem processes and functions. However, very few studies have undertaken a quantitative comparison of entire food webs from a key consumer perspective across a broad geographical area, limiting relevant comparisons among systems with distinct biotic and abiotic components. This paper investigates the structure and functioning of food webs in four tidal ecosystems of international importance for migratory shorebirds along the East Atlantic Flyway: Tejo estuary in Portugal, Sidi Moussa in Morocco, Banc d'Arguin in Mauritania and Bijagós archipelago in Guinea-Bissau. Basal food sources, shorebirds and their prey (benthic

invertebrates) were sampled in all areas, and Bayesian stable isotope mixing models and community-wide metrics were used in a comparative analysis among areas. Significant differences among study areas were found in the structure of food webs, as well as in the relative importance of basal resource pools supporting each food web...]

**Ceresa, F. ; Belda, E.J. ; Kvist, L. ; Rguibi-Idrissi, H. & Monrós, J.S.** 2015. Does fragmentation of wetlands affect gene flow in sympatric *Acrocephalus warblers* with different migration strategies? *Journal of Avian Biology* 46: 577-588. [Wetlands are naturally patchy habitats, but patchiness has been accentuated by the extensive wetlands loss due to human activities. In such a fragmented habitat, dispersal ability is especially important to maintain gene flow between populations. In this paper the authors studied population structure, genetic diversity and demographic history of Iberian and North African populations of two wetland passersines, the Eurasian reed warbler *Acrocephalus scirpaceus* and the moustached warbler *Acrocephalus melanopogon*. These species are closely related and sympatric in the study sites, but the reed warbler is a widespread long-distance migrant while the moustached warbler's breeding range is patchier and it is resident or migrates over short distances. Using microsatellite and mtDNA data, they found higher differentiation in moustached than in reed warblers, indicating higher dispersal capability of the latter species. Their results also suggest that the sea limits dispersal in the moustached warbler. However, they found evidence of gene flow between the study sites in both species, indicating a capability to compensate for habitat fragmentation. In most cases, the gene flow was restricted, possibly because of the large distances between study sites (from ca 290 to 960 km) or breeding site fidelity. The reed warbler had higher haplotype diversity, likely due to dispersal from different populations, past admixture event and a larger population size. They found also signs of postglacial population growth for both species and evidence of a recent colonization or re-colonization of the Mallorca Island by the moustached warbler. Etude menée dans trois stations espagnoles et une marocaine (Larache)]

Population structure and dispersal patterns within and between Atlantic and Mediterranean populations of a large-range pelagic seabird. *PLoS ONE* 8(8): e70711. doi: 10.1371/journal.pone.0070711. [Using molecular tools, the authors explored population structure and the spatial dispersal pattern of a highly pelagic but philopatric seabird, the Cory's shearwater *Calonectris diomedea*. Microsatellite fragments were analysed from samples collected across almost the entire breeding range of the species. To help disentangle the taxonomic status of the two subspecies described, the Atlantic form *C. d. borealis* and the Mediterranean form *C. d. diomedea*, they analysed genetic divergence between subspecies and quantified both historical and recent migration rates between the Mediterranean and Atlantic basins. They found a low genetic structure in the Mediterranean basin. Conversely, strong genetic differentiation appeared in the Atlantic basin. Even if the species was mostly philopatric (97%), results suggest recent dispersal between basins, especially from the Atlantic to the Mediterranean (approx. 10% of migrants/generation across the last two generations). Long-term gene flow analyses also suggested an historical exchange between basins (about 70 breeders/generation). Spatial analysis of genetic variation indicates that distance is not the main factor in shaping genetic structure in this species. Given their results they recommend gathering more data before concluded whether these taxa should be treated as two species or subspecies]

[Geolocation revealed that birds (n = 6) departed their Norwegian breeding site in the last part of July and all but one migrated south-west over continental western Europe. A single bird headed south-east to the Balkan Peninsula. As predicted, southbound migration proceeded in a typical skipping manner with 1-4 relatively short stopovers (median 4 d) during 10-27 d of migration before reaching north-west Africa. Here birds spent 11-20 d before crossing the Sahara. The non-breeding sites were located at or near the Niger River in Mali and were occupied continuously for more than 215 d with no indications of itinerancy. Spring migration commenced in late April/early May when birds crossed the desert and used stopover sites in the western Mediterranean basin in a similar manner as during autumn. The lowest body masses were recorded in spring at islands in the central Mediterranean basin, indicating that crossing the Sahara and Mediterranean barriers is exhausting to these birds. Hence, the skipping-type pattern of migration revealed by geolocators is likely to be natural in this species and not an effect of instrumentation]

**Lok, T. ; Overdijk, O. ; Piersma, T.** 2015. The cost of migration: spoonbills suffer higher mortality during trans-Saharan spring migrations only. *Biology Letters* 11: 20140944. <http://dx.doi.org/10.1098/rsbl.2014.0944> [The authors compared seasonal survival between Eurasian spoonbills (*Platalea leucorodia leucorodia*) that breed in The Netherlands and migrate different distances (ca 1000, 2000 and 4500 km) to winter in France, Iberia and Mauritania, respectively. On the basis of

resightings of individually marked birds throughout the year between 2005 and 2012, they show that summer, autumn and winter survival were very high and independent of migration distance, whereas mortality during spring migration was much higher (18%) for the birds that wintered in Mauritania, compared with those flying only as far as France (5%) or Iberia (6%)]

**López-López, P. ; García-Ripollés, C. & Urios, V.** 2014. Individual repeatability in timing and spatial flexibility of migration routes of trans-Saharan migratory raptors. *Current Zoology* 60: 642-652. [The authors investigated repeated migratory trips of a trans-Saharan endangered migratory raptor, the Egyptian Vulture *Neophron percnopterus*, tracked by GPS satellite telemetry. They compared between- and within- individual variation in migratory routes and timing in order to assess the degree of repeatability (or conversely, the flexibility) in migration. To this end, they analysed a dataset of 48 trips (23 springs and 25 autumns) recorded for six adult birds during 2007-2013. Egyptian vultures showed a consistent clockwise loop migration through western Africa, following more easterly routes in autumn than in spring. Finally, their results provide supporting evidence of low phenotypic plasticity in timing of migration (i.e. strong endogenous control of migration) and high flexibility in routes]

**Olsson, U. ; Rguiibi-Idrissi, H. ; Copete, J.L. ; Matos, J.L.A. ; Provost, P. ; Amezian, M. ; Alström, P. & Jiguet, F.** 2016. Mitochondrial phylogeny of the Eurasian/African reed warbler complex (*Acrocephalus*, Aves). Disagreement between morphological and molecular evidence and cryptic divergence: a case for resurrecting *Calamoherpe ambigua* Brehm 1857. *Molecular Phylogenetics and Evolution* 102: 30-44. [...] the *Acrocephalus* warblers breeding in south-western Europe and north-western Africa represent a distinct population, consisting of samples from Morocco, Spain, southern France and Lake Chad, Nigeria. This clade does not correspond to any taxon name in current use, but includes the lectotype of *Calamoherpe ambigua* (Brehm 1857) (from Valencia, Spain).... The authors propose that the name *ambigua* is resurrected for this clade in the form *ambiguus*, which is in grammatical agreement with the gender of *Acrocephalus*. The taxon *ambiguus* is a

small reed warbler, similar to *scirpaceus* in plumage, but intermediate between *scirpaceus* and *baeticatus* in morphology. For a detailed description, see Jiguet *et al.* (2010)<sup>1</sup>. Present evidence suggests that the moult strategy differs from that of *scirpaceus* (Svensson 1992<sup>2</sup>). At least Moroccan birds undergo complete moult (wing and tail) in autumn (Amezian *et al.* 2010<sup>3</sup>; Jiguet *et al.* 2010; Taillandier *et al.* 2006<sup>4</sup>).... The taxon *ambiguus* breeds discontinuously in wetlands of Morocco and Spain (Andalusia to at least Valencia), and probably most of the Iberian Peninsula, with Catalonia and southern France possibly being a zone of secondary intergradation (cf. Procházka *et al.* 2011<sup>5</sup>). In Morocco the taxon has been recorded to winter locally (Amezian *et al.* 2010). This taxon may also breed in Algeria (one specimen included in our morphometric analysis) and Tunisia. In the phylogenetic analysis by Winkler *et al.* (2013)<sup>6</sup>, the '*baeticatus*' clade contains samples from Spain, Portugal and Libya, indicating that *ambiguus* is one of the forms occurring in Libya. Sympatry with *A. s. scirpaceus* in the Benghazi area, Libya, was supported by both adults and eggs of both *scirpaceus* and "*baeticatus*" haplotype groups being recorded (Hering *et al.* 2010<sup>7</sup>), but no data on degree of assortative mating was reported]

- Seifert, N. ; Haase, M. ; Van Wilgenburg, S.L. ; Voigt, C.C. & Schmitz Ornés, A.** 2016. Complex migration and breeding strategies in an elusive bird species illuminated by genetic and isotopic markers. *Journal of Avian Biology* 47: 275-287. [Unlike the annual bi-directional movements of over 200 bird species within the Palaearctic-Afrotropical region, irregular movements such as irruptive migration with a low degree of philopatry are reported for a variety of species depending on highly seasonal and unpredictable resources. These flexible movements allow for itinerant breeding – consecutive breeding attempts in two or more geographically different regions during the same annual reproductive cycle. In order to illuminate migratory and breeding strategies of the erratic wetland species Baillon's crake *Zapornia pusilla* across the W-Palaearctic-Afrotropical region, the authors used a set of six DNA microsatellites as well as  $\delta^{2}\text{H}$  values of individuals sampled at one African and four European breeding sites. They investigated the degree of genetic population structure within and among different sites and assigned individuals' feathers of unknown origin to their probable moulting (hence breeding) site using a likelihood approach. They found three genetic clusters, differentiating into one 'European' and two 'African' populations. Connectivity between the sampling sites was probable as genetic 'African' individuals were found in breeding conditions in Europe and vice versa. Likewise, assigned moulting locations based on  $\delta^{2}\text{H}$  isoscapes suggested trans-continental movements as well as moulting and possibly breeding by the same individual both in African and European breeding grounds. Both isotopic and genetic data reveal the Baillon's crake pursue a complex migration and breeding strategy, allowing as well for irruptive movements and itinerant breeding across the W-Palaearctic-Afrotropical region. However, a better knowledge about the species' distribution as well as a more comprehensive data set, including samples from the southern and eastern boundaries of the distribution area would be necessary to improve the spatial resolution to the precision required to unambiguously infer migration directions and extent of exchange between African and European breeding grounds]

**Winkler, H. ; van Dongen, W. & Hering, J.** 2012. Der enigmatische Teichrohrsänger-Komplex *Acrocephalus [scirpaceus]*: Zimtrohrsänger *A. baeticatus* auf der Iberischen Halbinsel? *Limicola* 26: 310-321. [The enigmatic reed-warbler-complex *Acrocephalus [scirpaceus]*: African Reed Warblers *A. baeticatus* in the Iberian Peninsula? Recent years have seen great progress in our understanding of the distribution and population history of the Eurasian Reed Warbler *Acrocephalus scirpaceus*. However, many aspects still remain unclear, and the systematics and taxonomy of this superspecies still need to be resolved. While Eurasian migratory populations are sometimes treated as conspecific with the African Reed Warblers, recent texts treat these

two groups as different species, *Acrocephalus scirpaceus* and *A. baeticatus* with an assumed African origin. Within the migratory *scirpaceus* group, two subspecies are recognized, consisting of the western nominate form, and the eastern *fuscus* subspecies that breeds from eastern Turkey, the Levant and eastwards from the north Caspian area. These two subspecies are not separated by a geographical gap or barrier. In this study, samples from the whole distribution area from Kazakhstan over Saudi Arabia and North Africa to Europe were used. The genetic analyses were based mainly on the maternally inherited mitochondrial genome, and on the cytochrome *b* gene. According to these analyses, Iberian populations are more closely related to North African populations and those of northern Senegal, than to nominate *scirpaceus* and western *fuscus*. Following current systematic treatment, they should be classified as African Reed Warblers. However, it still remains to be shown that the latter are a close-knit group. It may well be that Iberian and North African birds constitute the remnants of a glacial refuge and are more closely related to *scirpaceus* than to nominate and other subspecies of "baeticatus". However, formulating any taxonomic consequences is premature as most parts of the African warbler breeding locations were not sampled. It is suggested that field ornithologists collect more data on the distribution, breeding and moulting phenology of round-winged reed warblers]
