---

Cette nouvelle livraison de nos ‘Eléments de bibliographie ornithologique marocaine’ regroupe une sélection d’articles traitant de l’avifaune du Maroc. Parmi ceux-ci, nous avons distingué, comme dans les livraisons précédentes, ceux traitant spécifiquement de ce pays de ceux de portée plus générale mais concernant aussi le Maroc. Un résumé informatif suit certains d’entre eux, en particulier lorsque le titre n’exprime pas de façon évidente le lien avec le Maroc.

Un troisième paragraphe présente une sélection de travaux récents relatifs à d’autres pays proches (Espagne et îles Canaries, Portugal, Libye, Tunisie, Algérie et Mauritanie en particulier), en lien direct avec l’avifaune marocaine.

Rappelons que la majeure partie de la bibliographie ornithologique marocaine disponible fin 2001 a été référencée dans ‘*The Birds of Morocco*’ (Thévenot, Vernon & Bergier 2003. British Ornithologist Union Checklist Series 20). Depuis, la majorité des nouveaux titres apparus ont été listés dans nos ‘Eléments de bibliographie marocaine’ :

- 1 (Bergier & Thévenot 2004 – *Go-South Bulletin* 1 : 7-12)
- 2 (Thévenot & Bergier 2005 – *Go-South Bulletin* 2 : 44-51)
- 3 (Thévenot & Bergier 2007 – *Go-South Bulletin* 4 : 32-41)
- 4 (Thévenot & Bergier 2008 – *Go-South Bulletin* 5 : 63-76)
- 5 (Thévenot & Bergier 2009 – *Go-South Bulletin* 6 : 113-123)
- 6 (Thévenot & Bergier 2010 – *Go-South Bulletin* 7 : 92-104)
- 7 (Thévenot & Bergier 2011 – *Go-South Bulletin* 8 : 44-52)
- 8 (Thévenot & Bergier 2012 – *Go-South Bulletin* 9 : 33-43)
- 9 (Thévenot & Bergier 2013 – *Go-South Bulletin* 10 : 86-101)
- 10 (Thévenot & Bergier 2014 – *Go-South Bulletin* 11 : 50-69)
- 11 (Thévenot & Bergier 2015 – *Go-South Bulletin* 12 : 84-98)
- 12 (Thévenot & Bergier 2016 – *Go-South Bulletin* 13 : 188-201)

Une ‘Bibliographie ornithologique marocaine’ est maintenue à jour à la rubrique ‘*Moroccan Bibliography*’ du site [www.go-south.org](http://www.go-south.org).

Nous serions reconnaissant à toute personne ayant connaissance de publications récentes non signalées dans nos ‘Eléments de bibliographie ornithologique marocaine’ de bien vouloir nous en faire part. De même,

nous vous remercions par avance de bien vouloir nous signaler toute erreur ou imprécision qui existerait dans les références présentées.

## 1. Nouveaux titres de bibliographie ornithologique marocaine

Il s'agit soit de titres parus en 2016 et début 2017, postérieurement à nos 'Eléments de bibliographie marocaine – 12' (cf. Thévenot & Bergier 2016 – *Go-South Bulletin* 13 : 188-201), soit de titres antérieurs non signalés dans nos douze précédentes livraisons.

**Alonso, J.C. ; Palacín, C. ; Onrubia, A. ; Abouloufae, R. ; Amezian, M. ; El Idrissi Essougrati, A. ; El Khamlich, R. & Noaman, A.** 2016. Alarming decline and range reduction of the highly threatened Great Bustard *Otis tarda* in Morocco. *Ostrich* 87: 277-280. [A Great Bustard *Otis tarda* survey carried out in spring 2015 in Morocco confirmed the decline of this highly endangered population. Bustards were only seen at two of the seven leks occupied ten years ago. The total number of birds counted was 40-44, which represents a 40% decline over the last decade. The sex-ratio was still strongly female-biased (1 male: 3 females), but less than in previous surveys, which suggests that trophy hunting has not been the major mortality cause in recent times. The productivity was 0.29-0.33 juveniles per female, the highest ever recorded in this population, suggesting that breeding success doesn't represent the main problem for the survival of this population. Based on the recent development of the power line network at some areas, the main threat today is probably collision with power lines. Reducing this mortality cause should be considered a high conservation priority]

**Aourir, M. ; Bousadik, H. ; Bekkay, M.E. ; Oubrou, W. & Znari, M.** 2017. New Breeding Sites of the Critically Endangered Northern Bald Ibis *Geronticus eremita* on the Moroccan Atlantic Coast. *International Journal of Avian & Wildlife Biology* 2 (3): 00021. [The Northern Bald ibis *Geronticus eremita*, is globally listed as a critically endangered bird species. The last surviving world population that occurs in the wild is mainly confined to the southwest of Morocco. The known breeding sites are almost restricted to the Souss-Massa National Park and Tamri area on the Morocco's Atlantic costal band south and north to Agadir city. During the 2017 reproductive season, the authors discovered two new breeding sites with at least three confirmed active nests incubated by adults at two distinct coastal cliffs. In addition, a flock of 11 to 15 ibises was located, at the northern coastline edges of the known breeding range in southwest Morocco. The new breeding sites of Northern Bald ibis described here suggest a current extension of the breeding range of this relict species along the Moroccan Atlantic coastline]

Integrating morphology, phylogeography, and ecological niche modeling to explore population differentiation in North African Common Chaffinches. *Journal of Ornithology* 158: 1-13. [Diagnosing distinct evolutionary taxa requires careful assessment of genetic, morphological, ecological, and behavioral variation within and among populations. In this study, data on phenotype (mensural and plumage coloration), genotype (mitochondrial DNA control-region sequences), and distributional projections derived from ecological niche models, were used to investigate population differentiation of North African Common Chaffinches. Results showed substantial genetic variation among populations, mostly (~56 %) distributed between Libyan populations and other North African populations, rather than within populations. Isolation-by-distance analysis indicated severely restricted gene flow between populations. Historical demographic analyses indicate that population expansion began before the Last Glacial Maximum, which is consistent with ecological niche model paleoprojections; interestingly, differentiation of the Libyan population (*Fringilla coelebs harterti*) apparently did not take place under the last glacial conditions. Hence, although its taxonomic status must await robust testing using multilocus DNA data, this population is an important element in the conservation of bird diversity in North Africa. Outre les *Fringilla coelebs harterti* de Libye, l'échantillonnage comprend des *Fringilla coelebs spodiogenys* de Tunisie, et des *F. c. africana* d'Algérie et du Maroc (Tangérois, Oriental, Plateau Central, Moyen Atlas, Haut Atlas et Tafilelt)]

**Segura, A.** 2017. How does vegetation structure influence woodpeckers and secondary cavity nesting birds in African cork oak forest? *Acta Oecologica* 83: 22-28. [The Great Spotted Woodpecker provides important information about the status of a forest in terms of structure and age. As a primary cavity creator, it provides small-medium size cavities for passerines. However, despite its interest as an ecosystem engineer, studies of this species in Africa are scarce. Here, spatially explicit predictive models were used to investigate how forest structural variables are related to both the Great Spotted

Woodpecker and secondary cavity nesting birds in Maamora cork oak forest (northwest Morocco). A positive association between Great Spotted Woodpecker and both dead-tree density and large mature trees (>60 cm dbh) was found. This study area, Maamora, has an old-growth forest structure incorporating a broad range of size and condition of live and dead trees, favouring Great Spotted Woodpecker by providing high availability of foraging and excavating sites. Secondary cavity nesting birds, represented by Great Tit, African Blue Tit, and Hoopoe, were predicted by Great Spotted Woodpecker detections. The findings suggest that the conservation of the Maamora cork oak forest could be key to maintaining these hole-nesting birds. However, this forest is threatened by forestry practises and livestock overgrazing and the challenge is therefore to find sustainable management strategies that ensure conservation while allowing its exploitation]

## 2. Autres titres d'intérêt général concernant l'avifaune marocaine

**Ait Belkacem, A. ; Gast, O. ; Stuckas, H. ; Canal, D. ; Lo Valvo, M. ; Giacalone, G. & Päckert, M.** 2016. North African hybrid sparrows (*Passer domesticus*, *P. hispaniolensis*) back from oblivion – ecological segregation and asymmetric mitochondrial introgression between parental species. *Ecology and Evolution* 5190–5206: doi: 10.1002/ece3.2274. [A stabilized hybrid form of the house sparrow (*Passer domesticus*) and the Spanish sparrow (*P. hispaniolensis*) is known as *Passer italiae* from the Italian Peninsula and a few Mediterranean islands. The growing attention for the Italian hybrid sparrow and increasing knowledge on its biology and genetic constitution greatly contrast the complete lack of knowledge of the long-known phenotypical hybrid sparrow populations from North Africa. This study provides new data on the breeding biology and variation of mitochondrial DNA in three Algerian populations of house sparrows,

Spanish sparrows, and phenotypical hybrids. In two field seasons, the two species occupied different breeding habitats: Spanish sparrows were only found in rural areas outside the cities and bred in open-cup nests built in large jujube bushes. In contrast, house sparrows bred only in the town centers and occupied nesting holes in walls of buildings. Phenotypical hybrids were always associated with house sparrow populations. House sparrows and phenotypical hybrids started breeding mid of March, and most pairs had three successive clutches, whereas Spanish sparrows started breeding almost one month later and had only two successive clutches. Mitochondrial introgression is strongly asymmetric because about 75% of the rural Spanish sparrow population carried house sparrow haplotypes. In contrast, populations of the Italian hybrid form, *P. italiae*, were genetically least diverse among all study

populations and showed a near-fixation of house sparrow haplotypes that elsewhere were extremely rare or that were even unique for the Italian Peninsula. Such differences between mitochondrial gene pools of Italian and North African hybrid sparrow populations provide first evidence that different demographic histories have shaped the extant genetic diversity observed on both continents]

**Åkesson, S. ; Bianco, G. & Hedenstrom, A.** 2016. Negotiating an ecological barrier: crossing the Sahara in relation to winds by common swifts. *Philos. Trans. R. Soc. Lond. B Biol. Sci.* 371: 20150393. doi: 10.1098/rstb.2015.0393. [The swifts *Apus apus* cross western Sahara on a broad front in autumn, while in spring they seem to use three alternative routes across the Sahara, a western, a central and an eastern route across the Arabian Peninsula, with most birds using the western route. The swifts show slower migration and travel speeds, and make longer detours with more stops in autumn compared with spring. In spring, the stopover period in West Africa coincided with mostly favourable winds, but birds remained in the area, suggesting fuelling. The western route provided more tailwind assistance compared with the central route for our tracked swifts in spring, but not in autumn. The ultimate explanation for the evolution of a preferred western route is presumably a combination of matching rich foraging conditions (swarming insects) and favourable winds enabling fast spring migration]

**Alves, J.A. ; Dias, M.P. ; Méndez, V. ; Katrínardóttir, B. & Gunnarsson, T.G.** 2016. Very rapid long-distance sea crossing by a migratory bird. *Scientific Reports* 6 (38154). [Landbirds undertaking within-continent migrations have the possibility to stop en route, but most long-distance migrants must also undertake large non-stop sea crossings, the length of which can vary greatly. For shorebirds migrating from Iceland to West Africa, the shortest route would involve one of the longest continuous sea crossings while alternative, mostly overland, routes are available. Using geolocators to track the migration of Icelandic whimbrels (*Numenius phaeopus*), we show that they can complete a round-trip of 11,000 km making two non-stop sea crossings and flying at speeds of up to 24 m s<sup>-1</sup>; one of the fastest recorded for shorebirds flying over the ocean. Although wind support could reduce flight energetic costs, whimbrels faced headwinds up to twice their ground speed, indicating that unfavourable and potentially fatal

weather conditions are not uncommon. Such apparently high risk migrations might be more common than previously thought, with potential fitness gains outweighing the costs]

**Chamorro, D. ; Olivero, J. ; Real, R. & Muñoz, A.R.** 2017. Environmental factors determining the establishment of the African Long-legged Buzzard *Buteo rufinus cirtensis* in Western Europe. *Ibis* 59: 331-342. [The African Long-legged Buzzard *Buteo rufinus cirtensis* has recently colonized Europe via the Strait of Gibraltar. We aim to explain the native distribution of this species and to predict favourable areas in newly colonized parts of Europe using geospatial modelling to identify the most influential factors in this process. We applied the favourability function, a generalized linear model describing environmental favourability, for the presence/absence of breeding areas in northern Morocco and the southern Iberian Peninsula, according to a set of variables describing climate, topography, human activity, vegetation and purely spatial trends. A model was built using some known breeding sites in northern Morocco, and was used to forecast future suitable breeding areas in Europe. A second model was built with the available data for northern Morocco and Europe to explain the current distribution of breeding sites. Both models were assessed according to discrimination, calibration and parsimony criteria, and the influence of each factor was analysed using variation partitioning. We conclude that the Iberian Peninsula could provide new suitable areas for the species and facilitate its northward expansion. This result, together with the increasing number of records available, suggests that this species could soon spread throughout Europe]

**Djerdali, S. ; Guerrero-Casado, J. & Tortosa, F.S.** 2016. The effects of colony size interacting with extra food supply on the breeding success of the White Stork (*Ciconia ciconia*). *Journal of Ornithology* 157: 941-947. [The study was carried out at 24 sites, including 88 different colonies of White Stork in northern Algeria, Sétif (36°09'N, 05°26'E; 900 m.a.s.l.) over a 4-year period (2002–2005) with considerable variation in rainfall. Nests were monitored at different distances from 30 rubbish dumps emanating largely from chicken farms. Results of the General Linear Mixed Models (GLMM) showed that breeding success of White Stork was dependent upon distance to dumps, recording the highest values in nests close to these places with food supply. There was a highly significant interaction between the year and the distance to the rubbish dumps]

Seabird diversity hotspot linked to ocean productivity in the Canary Current Large Marine Ecosystem. *Biology Letters* 12 (8): 20160024. [Upwelling regions are highly productive habitats targeted by wide-ranging marine predators and industrial fisheries. In this study, we track the migratory movements of eight seabird species from across the Atlantic; quantify overlap with the Canary

Current Large Marine Ecosystem (CCLME) and determine the habitat characteristics that drive this association. Our results indicate the CCLME is a biodiversity hotspot for migratory seabirds; all tracked species and more than 70% of individuals used this upwelling region. Relative species richness peaked in areas where sea surface temperature averaged between 15 and 20°C, and correlated positively with chlorophyll a, revealing the optimum conditions driving bottom-up trophic effects for seabirds. Marine vertebrates are not confined by international boundaries, making conservation challenging. However, by linking diversity to ocean productivity, our research reveals the significance of the CCLME for seabird populations from across the Atlantic, making it a priority for conservation action]

Unravelling the drastic range retraction of an emblematic songbird of North Africa: potential threats to Afro-Palearctic migratory birds. *Scientific Reports* 7 : 1092. [The authors investigate the cultural domestication of the European goldfinch (*Carduelis carduelis*) in western Maghreb (Morocco, Algeria and Tunisia) and the effects of long-term poaching of wild populations (1990-2016) on range distribution, socio-economic value, international trading and potential collateral damage on Afro-Palearctic

migratory birds. On average, they found that the European goldfinch lost 56.7% of its distribution range in the region which led to the increase of its economic value and establishment of international trading network in western Maghreb. One goldfinch is currently worth nearly a third of the average monthly income in the region. There has been a major change in poaching method around 2010, where poachers started to use mist nets to capture the species. Nearly a third of the 16 bird species captured as by-catch of the European goldfinch poaching are migratory, of which one became regularly sold as cage-bird. These results suggest that Afro-Palearctic migratory birds could be under serious by-catch threat]

**Ouwehand, J. & Both, C.** 2016. Alternate non-stop migration strategies of pied flycatchers to cross the Sahara desert. *Biology Letters* 12: 20151060. [Each year more than two billion songbirds cross the Sahara, but how they perform this formidable task is largely unknown. Using geolocation tracks from 27 pied flycatchers, a nocturnally migrating passerine, we show that most birds made diurnal flights in both autumn and spring. These diurnal flights were estimated to be part of non-stop flights of mostly 40–60 h. In spring, birds flew across the Sahara, while autumn migration probably circumvented part of the desert, through a long oversea flight. Our data contradict claims that passersines cross the Sahara by intermittent flight and daytime resting. The frequent occurrence of long non-stop flights to cross the desert shows migrants' physiological abilities and poses the question why this would not be the general migration strategy to cross the Sahara]

Seasonal detours by soaring migrants shaped by wind regimes along the East Atlantic Flyway. *Journal of Animal Ecology* 86: 179-191. [We tracked 62 migratory journeys of 12 adult European Honey Buzzards with GPS loggers.... Honey Buzzards cross western Africa using different routes in autumn and spring. In autumn, they overcompensated for westward winds to circumvent the Atlas Mountains on the eastern side and then overdrifted with south-westward winds while crossing the Sahara. In spring, however, they frequently overcompensated for eastward winds to initiate a westward detour at the start of their journey. They later overdrifted with side winds north-westward over the Sahel and north-eastward over the Sahara, avoiding adverse winds over the central Sahara. We conclude that Honey Buzzards make seasonal detours to utilize more supportive winds further en route and thereby expend less energy while crossing the desert]

- Hering, J. ; Winkler, H. & Steinheimer, F.D.** 2016. A new subspecies of Eurasian Reed Warbler *Acrocephalus scirpaceus* in Egypt. *Bulletin of the British Ornithologists' Club* 136: 101-128. [A new subspecies of European Reed Warbler *Acrocephalus scirpaceus* is described from the Egypt / Libya border region in the northern Sahara. Intensive studies revealed the new form to be clearly diagnosable within the Eurasian / African Reed Warbler superspecies, especially in biometrics, habitat, breeding biology and behaviour. The range of this sedentary form lies entirely below sea level, in the large depressions of the eastern Libyan Desert, in Qatara, Siwa, Sitra and Al Jaghbub. The most important field characters are the short wings and tarsi, which are significantly different from closely related *A. s. scirpaceus*, *A. s. fuscus* and *A. s. avicenniae*, less so from *A. baeticatus cinnamomeus*, which is more clearly separated by behaviour / nest sites and toe length. Molecular genetic analyses

determined that uncorrected distances to *A. s. scirpaceus* are 1.0–1.3%, to *avicenniae* 1.1–1.5% and to *fuscus* 0.3–1.2%. The song is similar to that of other Eurasian Reed Warbler taxa as well as that of African Reed Warbler *A. baeticatus*, but the succession of individual elements appears slower than in *A. s. scirpaceus* and therefore shows more resemblance to *A. s. avicenniae*]
